Open problems:
Inconsistent convergence in Hilbert space

Open problems raised by the technical brief in this directory, and by its Lean formalization (see `formalization-log.tex`). Items marked *research* are open research questions, not needed to check the brief.

From the brief

1. **A criterion of physical convergence.** *Research.* The brief concludes that the ℓ^2 topology "is too weak to take into account all conditions for a meaningful criterion of physical convergence". Which topology is the right one, and whether it is the Schwartz topology, is left open. (Brief, Sec. 4.)
